Event & Venue Booking Platform – Proposal

1. Project Overview

It will be a desktop-based application that will automate the venue booking process for events such as weddings, seminars, conferences, workshops, and social gatherings. Nowadays, most venue bookings are done manually through phone calls or physical visits, where double bookings and mismanagement can easily occur.

In the system, users can easily:

- check the venue
- availability calendar,
- submit booking requests,
- view payment records.

The admin will have control over

- approvals and rejections,
- manage the venue schedule
- generate reports.

This system will use Java, UIE, Swing, JavaFX for the frontend and Oracle, SQL as the backend, where all booking and payment data will be secure and well-organized.

2. Motivation

The motivation is that most booking solutions available in the market mainly focus on **ticket sales or event promotion**, but they do not properly handle **venue scheduling**.

For example, a university may need a hall for a seminar, or families may need a banquet hall for a wedding. Without a proper system, **schedule conflicts and payment disputes** can easily occur. The main motivation of this project is to **save time, avoid manual errors, and provide transparency** for both **users and venue managers**.

3. Objectives

The main project objectives will be:

- To develop a centralized platform where users can check venue availability.
- To automate booking requests and approvals.
- To provide a platform where families, universities and organizations can easily book venues.
- To manage booking payments by recording and organizing all transactions in the database for easy tracking and reporting.
- To provide a user-friendly GUI that is easy to use.

4. Expected Outcomes

The outcome of this project will be a fully functional desktop-based application that allows users to book venues at any time without any double bookings. Moreover, the administrators will be provided with a report of bookings so that they can easily check that which venues are booked more often and get a summarized view.

5. Project Scope

- The scope of this project includes universities, banquet halls, conference centers, and community halls.
- The system's backend will manage scheduling and payments.
- It can be extended with features like notifications, reminders, and online payment integration.

6. Tools and Technologies

- Frontend (GUI): Java Swing / JavaFX
- Backend (Database): Oracle SQL
- Programming Language: Java
- IDE: Eclipse / NetBeans / IntelliJ
